Compds. I [A = H, halogen, R1NHCO; B = (A)n, R1NHCO, R1CONH; C = R2CONH, AB R2NHCO; L, M = H, (un) substituted alkyl or aryl, alkoxy, amino, alkylamino, halogen, hydroxy, nitro, cyano, trifluoromethyl, trifluoromethoxy, (un) substituted aminocarbonyl; n = 1-4; Q, T, X, Z = C, N (one of Q, T, X, Z is N); R = H, alkyl, benzyl, 4-fluorobenzyl, (dialkylamino)alkyl; R1, R2 = H, (un)substituted alkyl, cycloalkyl, Ph, naphthyl, heteroaryl] such as II are prepared as inhibitors of IgE-mediated immune response for the treatment of allergies (particularly asthma) and proliferative diseases such as cancer; I are also prepared to suppress cytokines and leukocytes. Amination of 2-chloro-3 ,5-dinitropyridine, reduction of the 3-nitro group with ammonium sulfide, addition of 4-nitrobenzaldehyde, reduction of the nitro groups by hydrogenation with palladium on carbon, and acylation of the free amines with cyclohexanecarbonyl chloride yields II. Compds. of the invention suppress the IgE immune response by 50% at concns. between 100  $\mu$ M and 1 pM (no data). Methods for the preparation of the imidazopyridine invention compds. are also claimed.

AΒ

receptor, a purified human MCH1 receptor, vectors comprising isolated nucleic acid encoding a human MCH1 receptor, cells comprising such vectors, antibodies directed to a human MCH1 receptor, nucleic acid probes useful for detecting nucleic acid encoding human MCH1 receptors, antisense oligonucleotides complementary to unique sequences of nucleic acid encoding human MCH1 receptors, transgenic, nonhuman animals which express DNA encoding a normal or mutant human MCH1 receptor, methods of isolating a human MCH1 receptor, methods of treating an abnormality that is linked to the activity of a human MCH1 receptor, as well as methods of determining binding of compds. to mammalian MCH1 receptors. This invention further provides a method of treating a subject suffering from urinary incontinence which comprises administering to the subject an amount of an MCH1 antagonist effective to treat the subject's urinary incontinence or overactive bladder. Various 4-phenylpiperidine derivs., e.g (I), were synthesized and tested as human MCH1 receptor antagonists.

AB Aryl- and heteroaryl substituted urea compds. (W'NHC(:Y')N(R13)Z'; 1) useful in the treatment of diseases and conditions related to **DNA** damage or lesions in **DNA** replication are disclosed. In 1, W' is a six-membered aromatic ring containing at least 2 nitrogen atoms (e.g. pyrazinyl, pyrimidinyl, pyridazinyl, 1,2,4-triazinyl, quinoxalinyl) and optionally substituted as defined in the claims, Z' is a five- or six membered aromatic or heteroarom. ring as defined in the claims, Y' is O or S. The first claim contains a much more general formula WX1C(:Y)X2Z (e.g. X1

= null, O, S, CH2, NR1; X2 = O, S, NR1) but emphasis is on 1. Methods of making the compds., and their use as therapeutic agents, for example, in treating cancer and other diseases characterized by defects in DNA replication, chromosome segregation, or cell division also are described. Although the methods of preparation are not claimed, about 200 example prepns. are included. N-(2-methoxy-5-methylphenyl)-N'-(2-pyrazinyl)urea and N-(4-chloro-2-methoxyphenyl)-N'-(2-pyrazinyl)urea enhanced the killing of various human cells by 5-fluorouracil from 2- to 10-fold; in HeLa cells, these same compds. enhanced killing by irradiation 2-3 fold.

This application describes an **antibody** that specifically binds to a synthetic oligomer (e.g., an oligonucleotide or oligopeptide) having a organic protecting group covalently bound thereto, which **antibody** does not bind to that synthetic oligomer when the organic protecting group is not covalently bound thereto. Methods of making and using such **antibodies** are also disclosed, along with cells for making such **antibodies** and articles carrying immobilized oligomers that can be used in assay procedures with such **antibodies**.

Proteolipid subunits of vacuolar H+-ATPase (V-ATPase) as tumor antigens, use of antibodies and antisense oligonucleotides targeting those antigens as anticancer agent, and use of proton pump inhibitor as anticancer agent, are disclosed. Tumor antigen recognized by monoclonal antibody KCT-1 was isolated from thyroid cancer cell line TPC-1. The amino acid sequence of this antigen named SSY (S-1) was found match that of vacuolar H+-ATPase proteolipid subunit (ATP6F, c'' subunit). The epitope of SSY antigen for KCT-1 antibody was determined SSY antigen was found to strongly expressed in all the cancers examined; thyroid cancer, breast cancer, stomach cancer, esophagus cancer (squamous cell carcinoma), laryngeal cancer, colon cancer, rectal cancer, anal cancer, pancreatic cancer, lung cancer, renal cancer, bladder cancer, ovarian cancer, uterus cancer, cervical cancer, cunnus cancer, skin cancer, melanoma, central or peripheral nervous system cancer, gingival cancer, pharyngeal carcinoma, mediastinal tumor, liver cancer, bile duct cancer (cholangioma), gallbladder cancer, renal pelvis tumor, ureter cancer, testicular cancer, fallopian tube cancer, vaginal cancer, sarcoma, leukemia, erythroleukemia, multiple myeloma, malignant lymphoma, and carcinosarcoma. CDNA for a mouse homolog was cloned. Intradermal, s.c., and oral administration of the antigen in mouse demonstrated antitumor activity and safety. Antitumor activity was also demonstrated by phosphorothioate antisense oligonucleotide. Various inhibitors of V-ATPase, H+/K+-ATPase, and H+/Clsymporter were found to have antitumor activity.

1 The authors have examined the interaction of P2 antagonists with the human P2X7 receptor by studying their effect on 2' and 3'-0-

benzoyl-benzoyl-ATP (DbATP) stimulated cellular

accumulation of the fluorescent, DNA binding dye, YO-PRO-1 (MW = 375 Da). 2 In suspensions of HEK293 cells expressing human recombinant P2X7 receptors, DbATP produced time and concentration-dependent increases in YO-PRO-1 fluorescence. This response presumably reflects YO-PRO-1 entry through P2X7 receptor channels and binding to nucleic acids. When studies were performed in a NaCl-free, sucrose-containing buffer, full

concentration-effect curves to DbATP could be constructed. 3 The P2 antagonists, pyridoxalphosphate-6-azophenyl-2',4'-disulfonic acid (PPADS) and periodate oxidized ATP (oATP), reduced the potency of DbATP and decreased its maximum response. 1-[N,O-bis(1,5-isoquinolinesulfonyl)-N-methyl-L-tyrosyl]-4phenylpiperazine (KN62) and its analog, KN04, reduced the potency of DbATP. Schild slopes for KN62 and KN04 were shallow and exhibited a plateau at concns. of compound greater than 1  $\mu\text{M}\text{,}$  indicating that these compds. were not competitive antagonists. 4 Calmidazolium and a monoclonal antibody to human P2X7 receptors attenuated DbATP-stimulated YO-PRO-1 accumulation but they were not competitive antagonists and only produced 2-3 fold decreases in the potency of DbATP. 5 The effects of PPADS and KN62 were partially reversible whereas those of oATP were not. PPADS protected cells against

the irreversible antagonist effects of oATP suggesting a common site of action. In contrast KN62 was not effective suggesting that it may bind at a different site to oATP and PPADS. 6 This study has demonstrated that P2X7 receptor function can be quantified by measuring DbATP stimulated YO-PRO-1 accumulation and has provided addnl. information about the interaction of P2 receptor antagonists with the human P2X7 receptor.

The gene encoding acetyl CoA:deacetylvindoline 4-O-acetyltransferase (DAT) (EC 2.3.1.107) which catalyzes the last step in vindoline biosynthesis was isolated and characterized. The genomic clone encoded a 50-kDa polypeptide containing the sequences of nine tryptic fragments derived from the purified DAT heterodimer. However, cleavage of DAT protein to yield a heterodimer appears to be an artifact of the protein purification procedure, since the size of the protein (50 kDa) cross-reacting with anti-DAT antibody in seedlings and in leaves of various ages also corresponds to the size of the active recombinant Studies with the intact plant and with developing seedlings showed that induction of DAT mRNA, protein accumulation and enzyme activity occurred preferentially in vindoline producing tissues such as leaves and cotyledons of light-treated etiolated seedlings. The ORF of DAT showed significant sequence identity to 19 other plant genes, whose biochem. functions were mostly unknown. The Mr of ≈50 kDa, a

HXXXDG triad, and a DFGWGKP consensus sequence are highly conserved among the 20 plant genes and these criteria may be useful to identify this type of acyltransferase. The involvement of some of these genes in epicuticular wax biosynthesis, fruit-ripening and in benzoyl -transfer reactions indicates that the plant kingdom contains a superfamily of multifunctional acyltransferases which operate by a

reaction mechanism related to the ancient chloramphenicol

O-acetyltransferase and dihydrolipoyl acetyltransferase class of enzymes. REFERENCE COUNT: THERE ARE 35 CITED REFERENCES AVAILABLE FOR THIS 35 RECORD. ALL CITATIONS AVAILABLE IN THE RE FORMAT

LANGUAGE: English SUMMARY LANGUAGE: English

There is now conclusive evidence that extracellular nucleotides acting via AB cell surface P2 receptors are important local modulators of bone cell function. Multiple subtypes of P2 receptors have been localized to bone, where their activation modulates multiple processes including osteoblast proliferation, osteoblast-mediated bone formation, and osteoclast formation and resorptive capacity. Locally released nucleotides also have been shown to sensitize surrounding cells to the action of systemic factors such as parathyroid hormone (PTH). In nonskeletal tissue recent attention has focused on one particular P2 receptor, the P2X(7) receptor (previously termed P2Z), and its ability to form nonselective aqueous pores in the plasma membrane on prolonged stimulation. Expression of this receptor originally was thought to be restricted to cells of hemopoietic origin, in which it has been implicated in cell fusion, apoptosis, and release of proinflammatory cytokines. However, recent reports have indicated expression of this receptor in cells of stromal origin. In this study, we investigated the expression of the P2X(7) receptor in two human osteosarcoma cell lines, as well as several populations of primary human bone-derived cells (HBDCs) at the levels of messenger RNA (mRNA) and protein. We found that there is a subpopulation of osteoblasts that expresses the P2X(7) receptor and that these receptors are functional as assessed by monitoring ethidium bromide uptake following pore formation. Inhibition of delayed lactate dehydrogenase (LDH) release in response to the specific agonist 2',3'-(4-benzoy1)-

benzoyl-adenosine triphosphate (BzATP) by the nonspecific P2X receptor antagonist PPADS confirmed a receptor-mediated event. After treatment with BzATP SaOS-2 cells exhibited dramatic morphological changes consistent with those observed after P2X(7)-mediated apoptosis in hemopoietic cells. Dual staining with terminal deoxynucleotidyl transferase-mediated deoxyuridine triphosphate-biotin nick end labeling (TUNEL) and a P2X(7)-specific monoclonal antibody confirmed the induction of apoptosis in osteoblasts expressing the P2X(7) receptor. These data show for the first time the expression of functional P2X(7) receptors in a subpopulation of osteoblasts, activation of which can result in ATP-mediated apoptosis.

AB The benefit of chemotherapy in the treatment of advanced colorectal cancer has now been clearly demonstrated with several studies reporting advantages in terms of overall survival, quality of life and effective palliation following chemotherapy plus supportive care in comparison to supportive care alone. However, the survival benefit achieved with the

current 5-fluorouracil (5-FU)-based regimens is modest and thus investigations are ongoing to identify more effective agents with novel mechanisms of action. The three new agents likely to have the greatest impact in the near future are the thymidylate synthase inhibitor ZD1694 (Tomudex®), the topoisomerase I inhibitor irinotecan (Campto®) and the new platinum compound, oxaliplatin (L-OHP®). Promising response rates of 26 and 20% have been reported with ZD1694 in patients with advanced colorectal cancer in phase II and III studies, respectively. In a European phase II study, irinotecan has achieved response rates of 19% in chemotherapy-naive patients and 18% in pretreated patients with advanced disease. Oxaliplatin has mainly been investigated in combination with continuous infusion 5-FU, with response rates of 29-58%. Other agents currently in development include monoclonal antibodies (e.g. 17-1A and MN-14), protein synthesis inhibitors (e.g. RA 700) and angiogenesis inhibitors (e.g. PF 4).
